KLIA selects iOmniscient

Kuala Lumpur International Airport has decided to use iOmniscient's IQ series software for their latest security upgrade. After an extensive search and evaluation process which involved visiting airports around the world they selected iOmniscient's video analysis system.

With a range of applications in mind KLIA will be implementing some of the simpler applications as well as IQ Infinity for the most complex scenes.

Dr Rustom Kanga, iOmniscient CEO, commented that "airports can be very complex environments. In particular they have to cope with very crowded scenes. If counting is difficult when there are one or two people to be counted it can be much more difficult to count crowds. If detecting abandoned luggage is difficult in an empty scene, it is even more so in a crowd. If faces are difficult to recognize accurately when a single face is presented to a camera, it is far more difficult to do it in a crowd. Yet working in crowded scenes is iOmniscient's speciality – this is where we have most of our patents and this is the reason organizations with complex requirements such as airports and railways use us."

iOmniscient's partner, GTC Global will be the systems integrator for this project.
